

Continuous Compliance Management

OTORIO's Risk Assessment, Management, and Monitoring platform (RAM²) incorporates easy-to-use Industrial Compliance Governance and Management capabilities that ensure continuous compliance and policy fulfillment. The solution significantly improves the Operational Technology (OT) compliance governance's efficiency and accuracy by shortening the time and reducing the required resources. Most importantly, it reduces the risks of non-compliance with essential standards and organizational policies.

Simplify Compliance Governance

OTORIO's RAM² compliance dashboard provides visibility of the compliance standards and organizational policy fulfillment status in one-click. The dashboard is automatically adjusted to the chosen compliance standard, providing an overall score, score per specific standard chapter, and a clear view of all open compliance issues. The dashboard can be generated at the site level and up to the entire enterprise, allowing prioritization and delegation.

Continuous Compliance Mapping

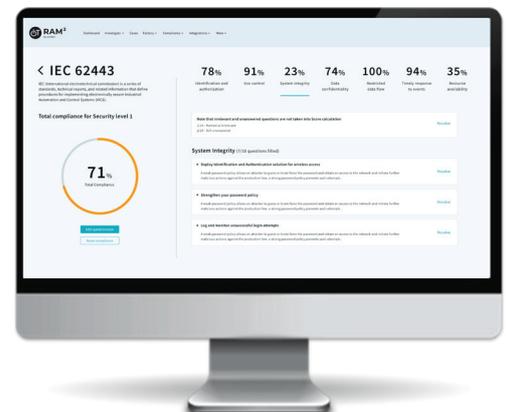

Traditional, manual compliance mapping processes are complex and often require third-party services to be achieved. As a result, they are usually done periodically, once a year or less. OTORIO simplifies the process by converting the complex, challenging to understand, and long standard documents into a straightforward automated and simple questionnaire, easily understandable by operational teams. Answering the questions doesn't require any familiarity with the compliance standard or regulations and can be answered by the company's employees without additional upskilling. The simple solution enables continuous compliance mapping.

Dynamic Compliance Score

OTORIO's RAM² solution calculates a compliance score based on the questionnaire's answers and based on information collected by RAM² automatically. The score is calculated for each standard chapter separately, which enables prioritization of remediation actions while focusing on the most severe gaps compared to the expected level of compliance for each topic. In addition, a score is calculated for each site in the environment separately, which enables prioritization based on the operational impact. RAM² aggregates the different scores to formulate the overall score, providing a clear understanding of the compliance status and gaps. The score is automatically updated when issues are resolved, allowing tracking of the compliance improvement over time.

Benefits

- Simplify compliance governance
- Achieve continuous fulfillment
- Ease resolution by providing simple instructions
- Facilitate compliance score improvement
- Increase accuracy and efficiency
- Track multiple standards
- Manage organizational-tailored policies
- Automate compliance reporting

Multiple Policies Tracking

There are many cybersecurity standards. Some are generic, while others are vertical oriented; some are standalone, while others are a series. Many cybersecurity standards relate to operational technology, directly or indirectly. OT-Specific standards include the “Industrial communication networks” standards series (IEC-62443) and the “Guide to Industrial Control Systems (ICS) Security” (NIST 800-82). Other essential standards are the risk management and assessment cybersecurity standards and industry-specific standards such as pharmaceutical, automotive, and energy regulatory and safety standards.

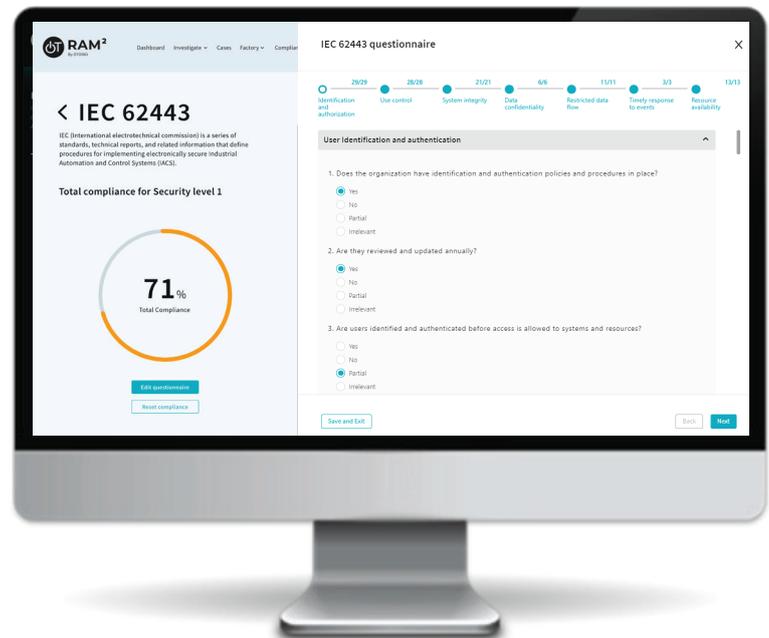

OTORIO’s RAM² compliance solution enables the support of any required standard or series, adapted to the customer’s needs. The most popular standards for the compliance of industrial networks cybersecurity, including IEC-62443 and NIST 800-82, are covered by RAM² out-of-the-box. Additionally, organizational policies can be introduced to RAM² compliance.

Compliance Fulfillment Recommendations

OTORIO’s RAM² compliance solution provides a list of specific, actionable compliance issues with simplified resolution instructions. Once the issue is marked in the system as resolved, the risk score is updated accordingly. The result is a continuous improvement process that ensures meeting regulatory requirements and reduces cybersecurity risks in the operational network.

Reports

OTORIO’s RAM² compliance reports ensure transparency and cooperation between different teams. The reports include overall compliance score and status and detailed compliance fulfillment and gaps information. The reports can be generated at various operational levels, from the smallest operational unit, throughout the site. Enterprise-level reports can be generated with RAM² Enterprise.

About OTORIO

OTORIO delivers next-generation OT security and digital risk management solutions that ensure reliable, safe and efficient industrial digitalization. The company combines the professional experience of top nation-state industrial cybersecurity experts with cutting edge digital risk management technology to provide the highest level of protection to the manufacturing industry.
